

# ***Wildlife Control***

## **Aims:**

- **understand the reasons for wildlife control**
- **understand the control methods**
- **learn how to assess success or failure in control programs**
- **consider some of the complications in control programs**
- **develop approaches to problem resolution**
- **examine the ethics of vertebrate wildlife control**

## ***Reasons for wildlife control***

- **damage to agricultural and horticultural crops**
- **damage to forestry nurseries and plantations**
- **damage to ecosystems that need to be conserved**
- **competition with livestock for feed**
- **the risk of predation of livestock and farmed fish**
- **the risk of predation of game animals**
- **the risk of predation of endangered wildlife**
- **the risk of transmission of specific diseases to livestock**
- **the risk of zoonotic diseases spreading to man**
- **damage to property**
- **consumption and contamination of stored feedstuffs**
- **the risk of overpopulation (and emaciation) in the species**

# ***Wildlife control for animal disease control purposes***

- ***Mycobacterium bovis*** and brushtail possums in NZ
- ***Mycobacterium bovis*** and badgers in UK
- **Maintenance hosts & Spill-over hosts**

# ***Examples of some topical zoonoses transmitted by wildlife***

- Alveolar hydatid disease – *Echinococcus multilocularis* & urban foxes
- Haemorrhagic fever with renal syndrome – *Hantavirus* & rats
- Leptospirosis – *Leptospira* spp. & rats
- Bird ‘flu’ – avian influenza A virus subtype H5N1 & wild waterfowl
- Toxoplasmosis – *Toxoplasma gondii* & feral cats
- Lassa fever – *Arenaviridae* virus & mice

# Hantavirus has been isolated from the following rodent species in Brazil:-

*Akodon monotensis*

*Akodon paranaensis*

*Akodon serrensis*

*Oligoryzomys nigripes*

*Oxymycterus judex*

**In a recent study in Salvador, 142 wild *Rattus norvegicus* were captured and tested for *Leptospira* species. 80% of the rats tested positive for *Leptospira* in their urine and kidneys, and 68% had positive antibody titres in their serum.**

**This study was conducted after the flood-associated outbreak of Leptospirosis which killed 50 people in Salvador.**

# ***Approaches in Wildlife Control Programs***

## ***Three key components***

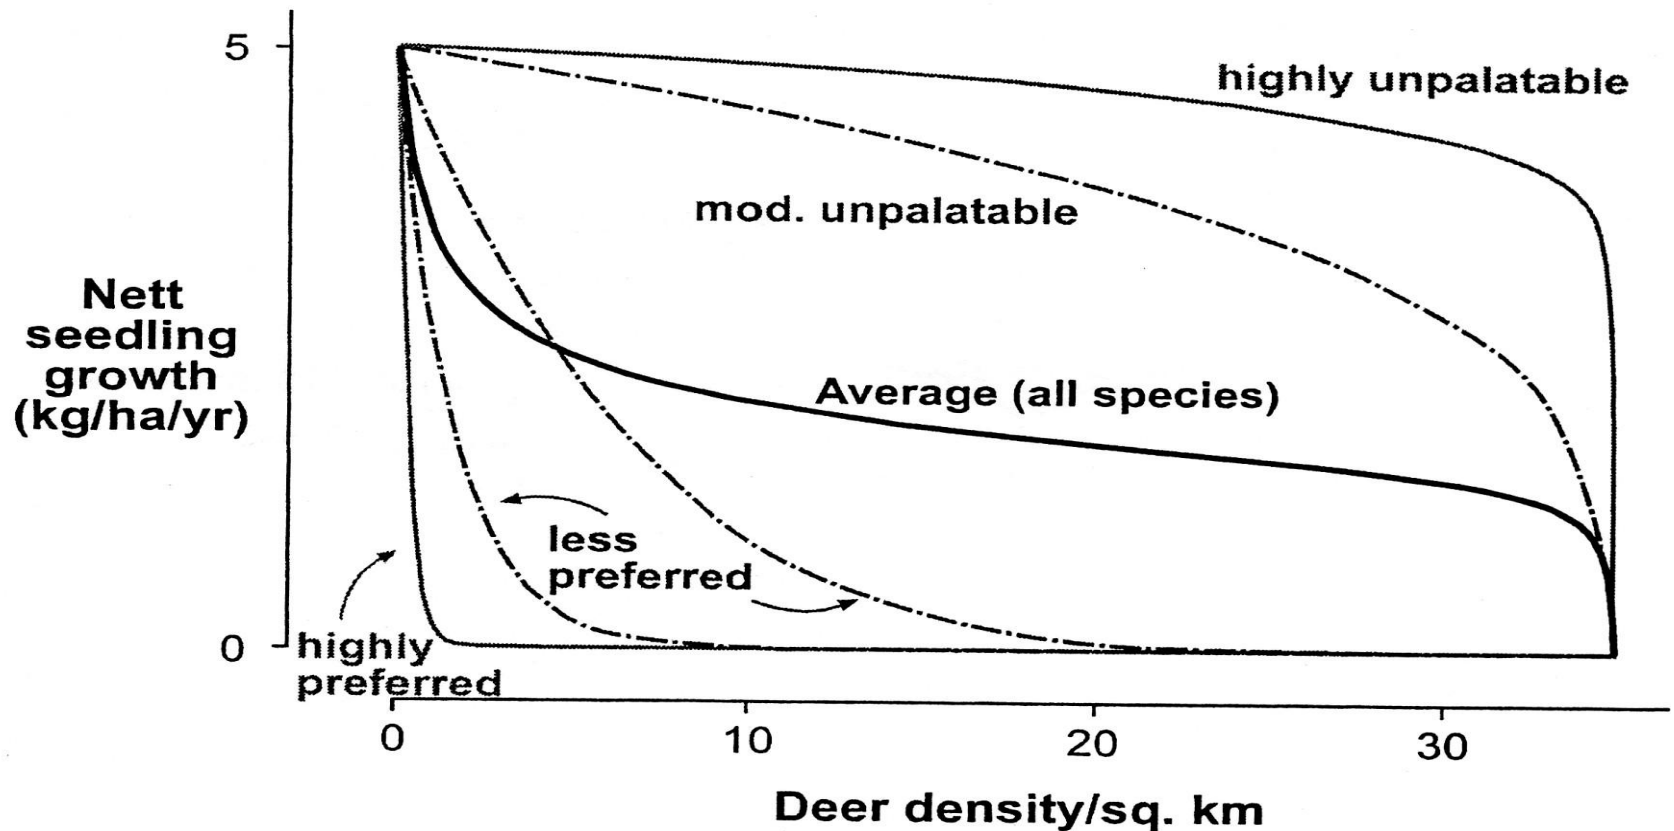

- **set clearly defined objectives**
- **decide how to achieve those objectives**
- **monitor the outcome of the plan**

**Goals should be transparent and defensible,  
even when outcomes are uncertain**

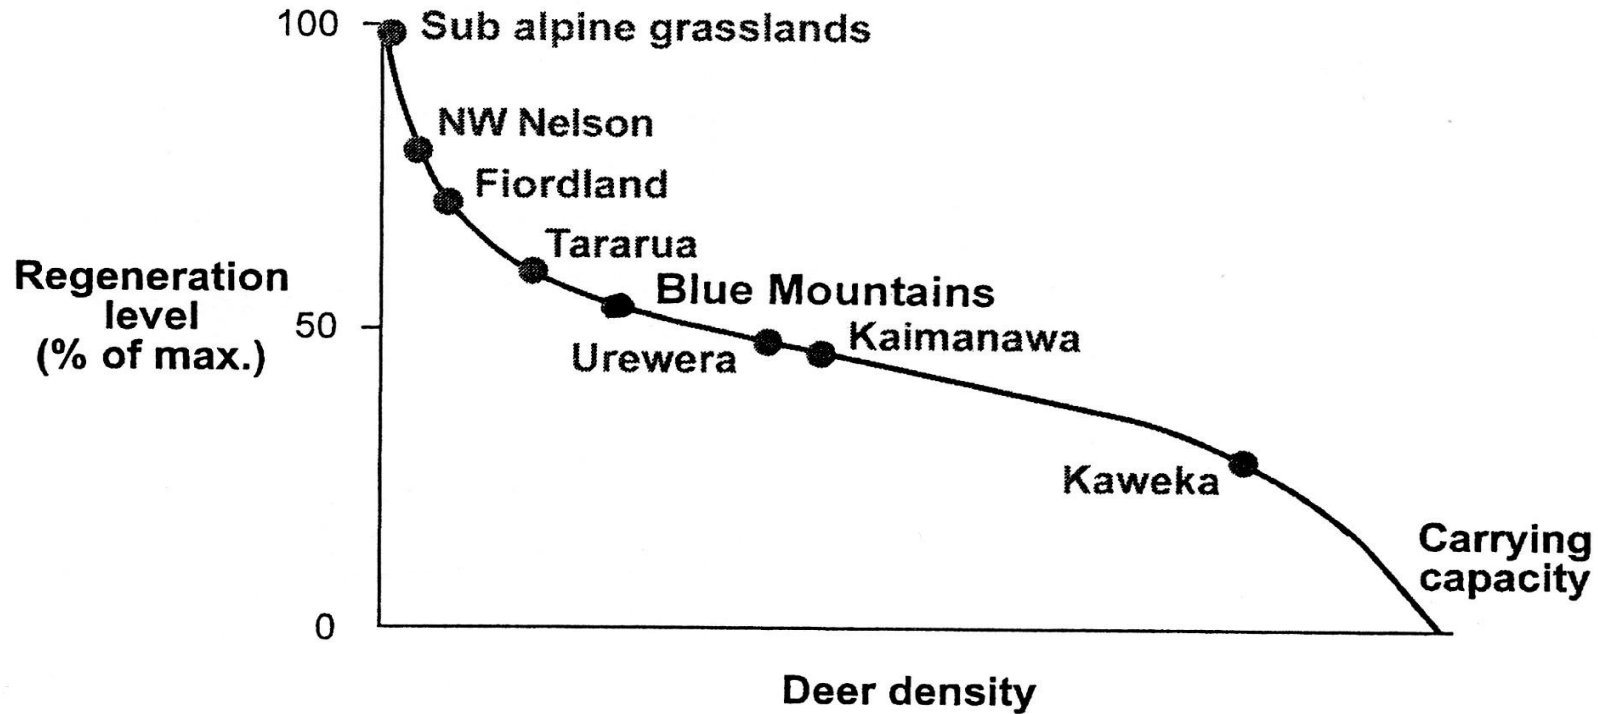

**Red deer** *Cervus elaphus*

# ***Determining the optimum or tolerable population density or size of a pest***

# ***Deer density and Regeneration rate of indigenous vegetation***

## ***Conclusions from this example***

- almost complete removal of deer would be needed to protect plant species that are highly preferred by deer and may be endangered
- when the seed bank in the soil has been exhausted, natural regeneration of the endangered plant species is lost

# ***Control Strategies***

- **damage control**
  - **deterrents**
  - **exclusion**
- **pest control**
  - **sustained destruction**
  - **eradication**

# ***Exclusion, deterrents and predation***

## ***Repellent, deterrent and exclusion devices include***

- Noise emitters – bird scarer guns, ultrasound alarms
- Visual scarers –
- Chemical repellents – copper acetate to repel sharks
- Habitat removal – roost removal around fruit farms
- Exclusion – electric fencing, vermin proof doorways
- Feed competition – encouraging competitors which are less of a pest

# ***Killing Methods***

- Toxicants
- Introduced disease
- Traps and snares
- Hunting, shooting and fishing

# **Make sure you understand the advantages and disadvantages of .....**

- Introducing a disease to control the pest
- Introducing predators to control a pest
- Bounty systems
- Recreational hunting in pest control
- Control leading to Vacuum effects
- The different measures of success
  - catch rates
  - scat density
  - feed removal/activity at chew stations
  - head counts/plot occupancy
  - runway/burrow opening counts
  - impact assessment

# ***Pest Control Methods***

- ***Toxicants***
- ***Traps and snares***
- ***Hunting, shooting & fishing***
- ***Introduced diseases***
- ***Introduced predators***

# ***Welfare Compromise***

The severity of a welfare compromise (W)

$$\alpha \quad N \quad I \quad D \quad C$$

*N – number of animals affected*

*I – intensity of suffering*

*D – duration of suffering*

*C – capacity of the animal to suffer*

# ***Toxicants***

- ***1080***
  - ***Alpha chloralose***
  - ***Anticoagulants***
    - ***brodifacoum***
    - ***bromadiolone***
    - ***pindone***
    - ***racumin***
    - ***warfarin et al.***
  - ***Bromethalin***
  - ***Carbon monoxide***
  - ***Chloropicrin***
  - ***Cholecalciferol***
  - ***Phosphorus***
  - ***Potassium cyanide***
  - ***Rotenone***
  - ***Strychnine***
  - ***Zinc phosphide***
- Discontinued:-*
- ***Alpha naphthylthiourea***
  - ***Magnesium cyanide***

# ***Acceptability Rating***

***0    Least acceptable***

***5    Highly acceptable***

**5/ Av-alarm**

**Shoo-roo**

**Electronic repellents**

**Denatonium benzoate**

**Polybutene**

**Methiocarb**

**4/  $\alpha$ -chloralose**

**potassium cyanide**

**carbon monoxide**

**head shot- rifle**

**head shot – shotgun (close)**

**cage and box traps**

**3/ 1080**

**Mist nets**

**Net guns**

**2/ Padded leghold trap**

**Conibear trap**

**Phosphorus**

**Anticoagulants**

**Bromethalin**

**RCD**

**Warren ripping**

**Leg and neck snares**

**Break-back trap**

**1/ Unpadded leghold traps**

**Glueboards**

**Strychnine**

**Myxomatosis**

**0/ Lanes Ace leghold trap**

**Cholecalciferol**

**Chloropicrin**

***Shoo roo***

***Glue board***

***Mist net***

# ***Traps and Snares***

## ***Live traps***

Cage traps

Box traps

Nets

Pitfall traps

Leg snares

Neck snares with stops

Leg-hold traps

Glue boards

## ***Kill traps***

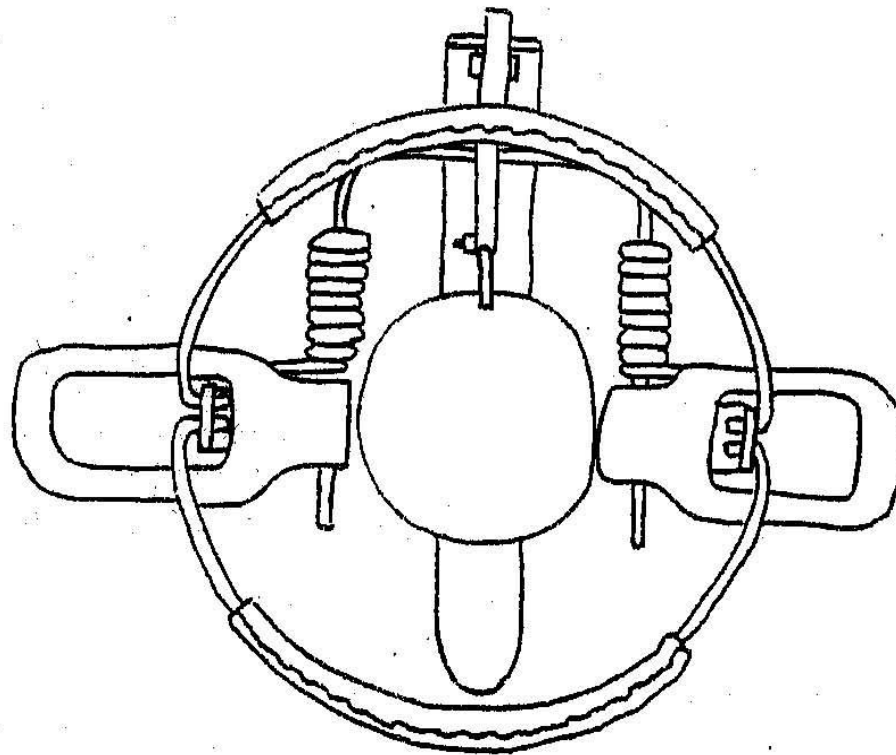

Neck-hold traps

Neck snares without stops

Break-back traps

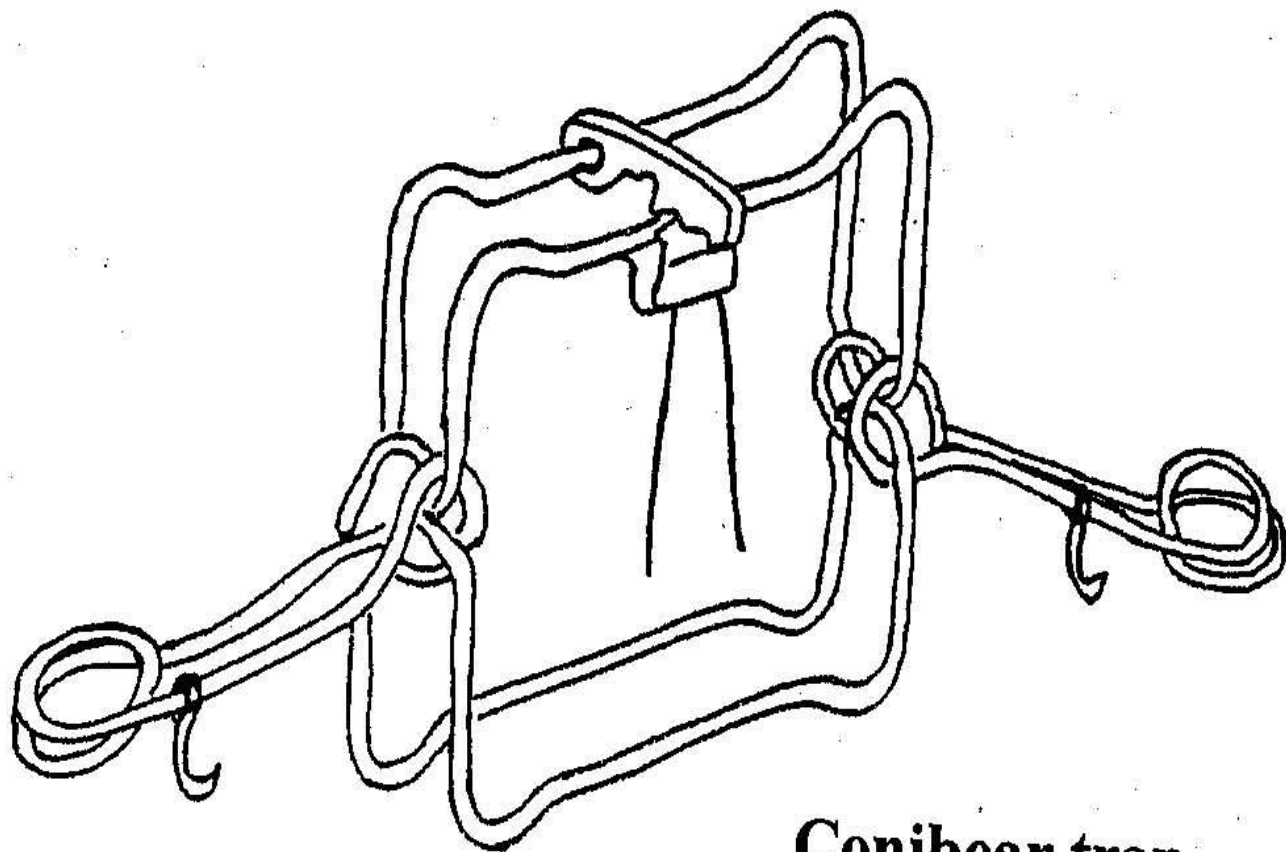

Body-catch traps

Crushing devices

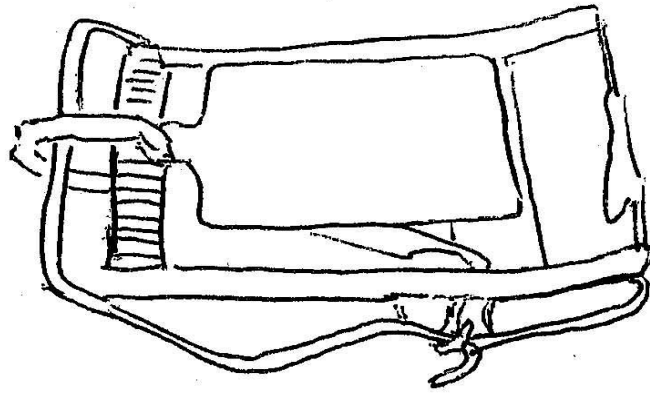

**Leg hold trap (padded)**

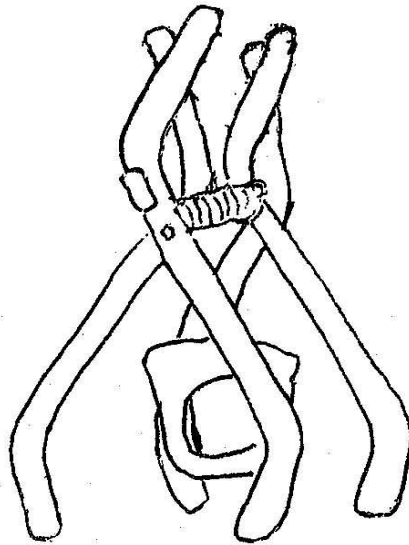

**Conibear trap**

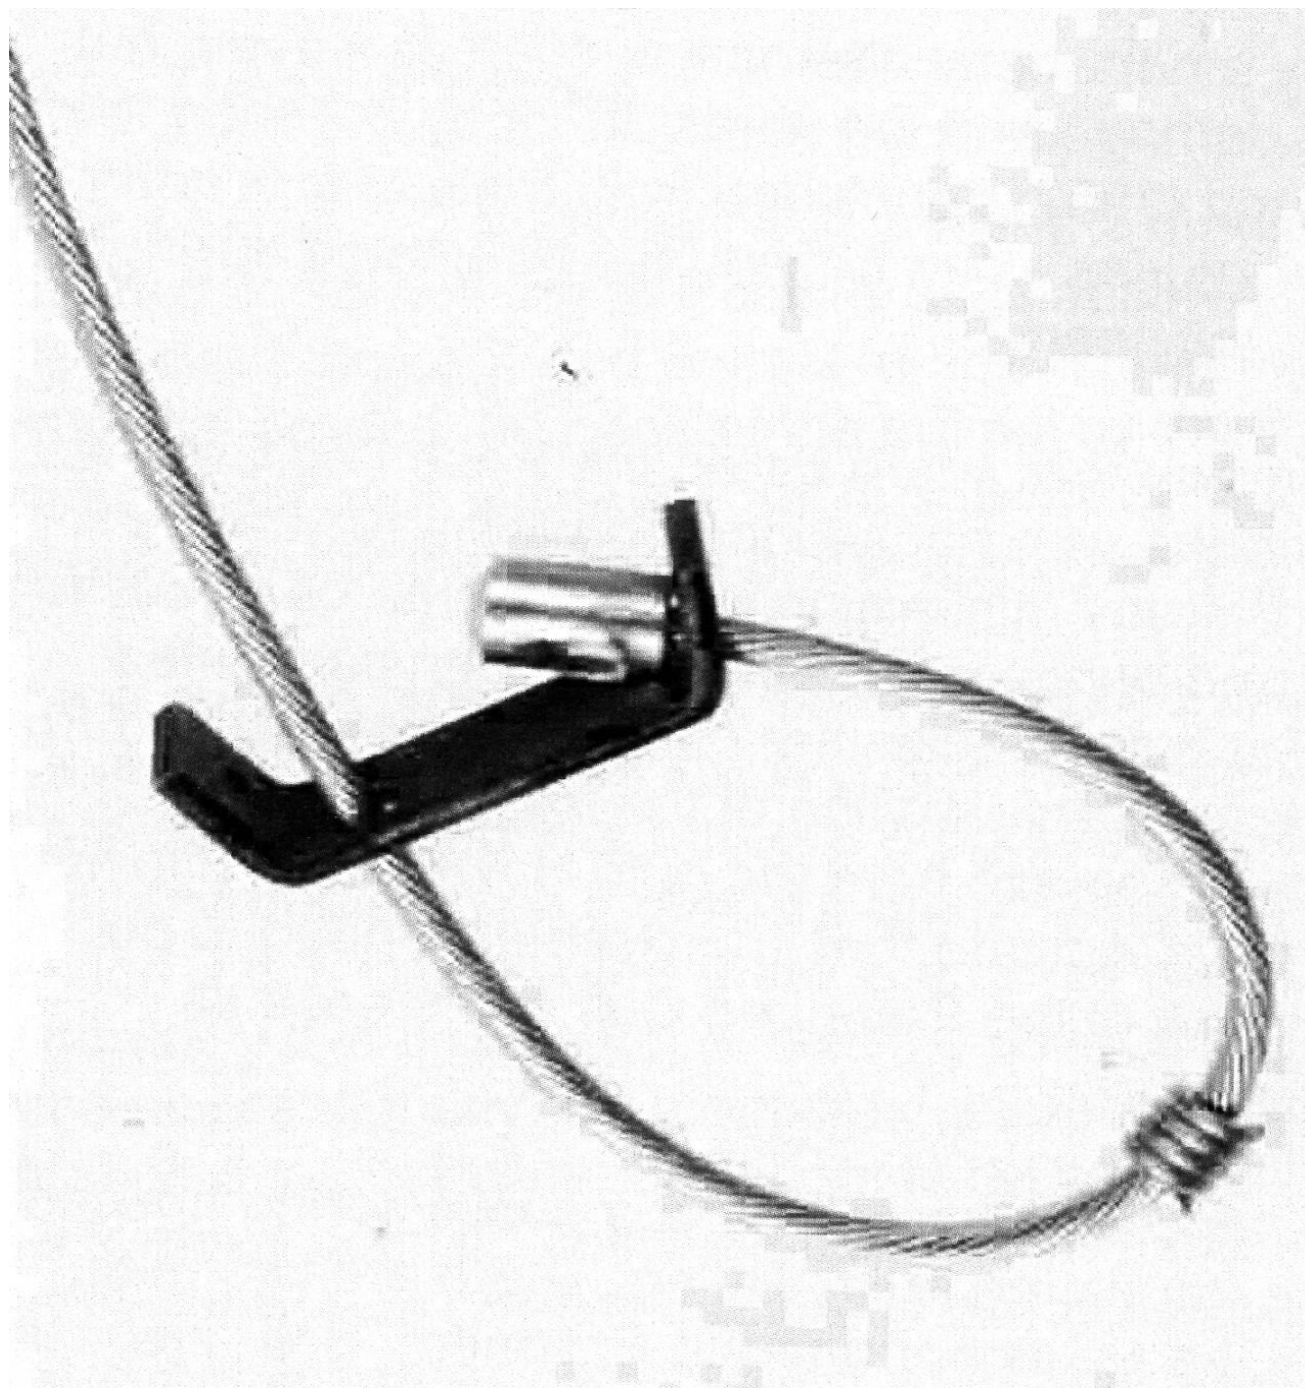

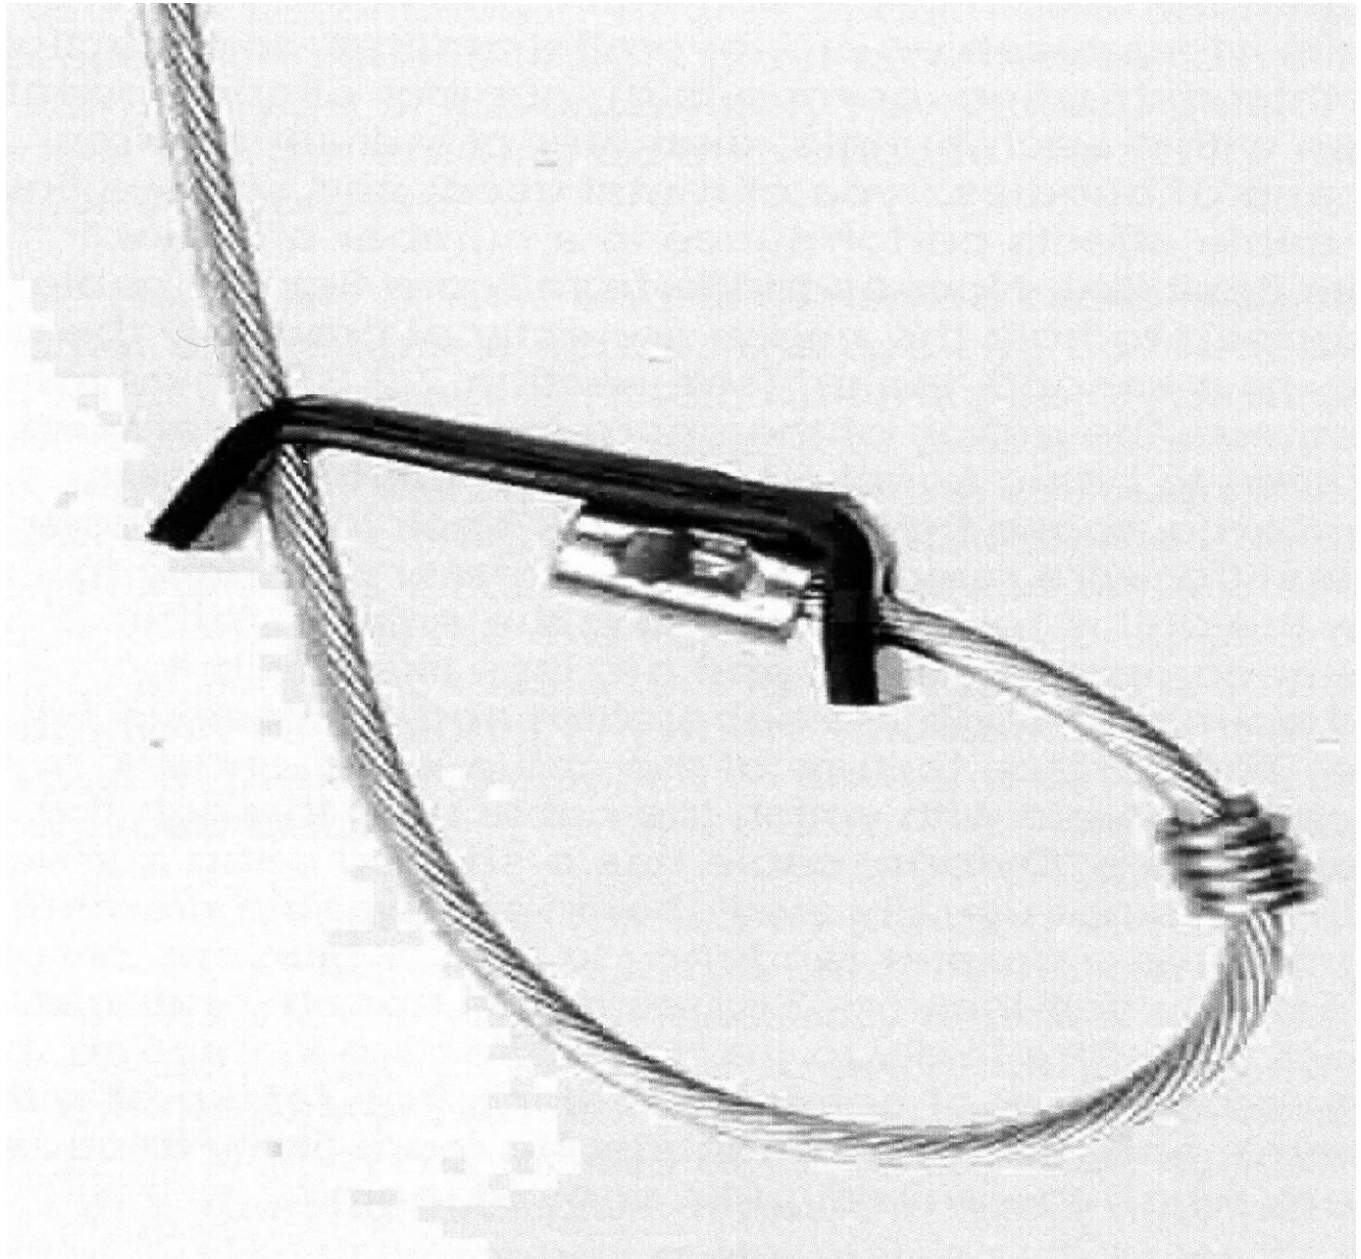

**Fenn trap**

**Scissor trap**

# ***Shooting***

***On average 14 % of ducks  
were carrying birdshot  
pellets (Norman 1976)***

***On average 14 % of willow  
ptarmigan were carrying  
birdshot pellets  
(Holmstad 1998)***

# ***Introduced diseases***

## ***Myxomatosis***

- ***time to death 10 to 50 days***
- ***skin swellings after 4 to 5 days***
- ***conjunctival swellings 5 to 6 days***
- ***eyes can be completely closed at day 7***
- ***death from secondary infections (esp. In lungs)***

## ***Rabbit calicivirus***

- ***liver damage with disseminated intravascular coagulopathy***
- ***death from a stroke or cardiac irregularities***
- ***not all deaths are quick***

# ***Introduced predators***

## ***Advantages***

- ***low cost***
- ***low effort***

## ***Disadvantages***

- ***predator will take non-target species***
- ***predator may become a pest itself***
- ***not always effective***

# ***Ethics of Wildlife Control***

***Viewpoints on the ethics of wildlife control can fall in 4 positions:-***

***deontological***

***axiological***

***teleological***

***consequentialist***

# ***Is it Fair Analysis***

- ***Is it Fair ?***
- ***Is it Necessary ?***
- ***Are there Alternatives ?***

# ***SPACE Analysis***

**S - Society**

**P - Producers**

**A - Animals**

**N - Nation**

**C - Control Agency**

**E - Ecosystem**

# Use an 'Is it Fair .....

## Analysis for assessing the Ethics of controlling the following Wildlife species

### Wildlife species

Jaguar (*Panthera onca*)

Black vulture (*Coragyps atratus*)

Wild boar (*Sus scrofa*)

Capybara (*H. hydrochaeris*)

### Reason for control

Loss of calves

Loss of calves

Crop damage, lambs

Crop damage, zoonosis  
(maculosal fever)
